DETAILED ACTION

Claim Objections

1. Claims 9-14 objected to because of the following informalities:

In the body of claim 9, applicant has referred to a membrane (lines 14 and 18) which has not been claimed in the body of the claim. Applicant has made a reference to the membrane in the preamble in the claim, but not in the body. Therefore, the Examiner is not required to give the membrane patentable weight in examining the claims against the prior art. If applicant wishes to include this element in the apparatus of claim 9, appropriate correction is required. In the form the claim is currently written, the Examiner searched for prior art which did not contain a membrane element.

Claim Rejections - 35 USC § 102

2. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

3. Claim 9 is rejected under 35 U.S.C. 102(b) as being anticipated by Gioia (U.S. Pat. No. 4,274,286). Gioia teaches an apparatus for measuring the flowability of powder comprised of a container with an opening in the bottom. The apparatus is best shown in Figure 6 and has a cylindrical body (1) with open ends and an end cap (3) with an opening.

Allowable Subject Matter

4. Claims 1-8 and 15-18 are allowed.

Claims 10-14 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims and are rewritten in a form which does not duplicate the elements of claims which have already been deemed allowable.

5. The following is a statement of reasons for the indication of allowable subject matter: In claim 1, applicant has claimed an apparatus with the following combination of elements: a tubular body with opposed ends, one of them being open; an end cap with a sidewall and a flange extending substantially perpendicularly inwardly from the cap to forming a support surface and also surrounding and defining an aperture, said end cap removably attached to the open end of the tubular body; a porous membranes positioned within the end cap on the support surface; and a ring sized to fit coaxially within the end cap contiguous with the membrane wherein the membrane is sandwiched between the end cap and the ring. The Examiner did not find prior art that contained or suggested this combination of features.

Conclusion

6. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. Cosgrove, Jr. et al. (U.S. Pat. No. 4,578,244), Little et al.
